TECHNICAL SUMMARY

Flutter and visual engineer with 5+ years building production-grade, cross-platform products for Android, iOS, Windows, and Web. Engineering depth covers clean architecture (GetX Pattern, SOLID principles, stream-first reactivity), multi-flavor monorepo builds, GetX state management, and Firebase at scale - Firestore, Cloud Functions, Auth, and Hosting - supported by a rigorous unit, widget, and integration testing discipline. Visual engineering depth covers the full design stack: end-to-end product design in Figma, design systems and tokens, component libraries, multi-role UX flows, and high-fidelity prototyping from blank canvas to production-ready interface, without a design handoff. Owns the complete product vertical across B2B, B2C, and B2G, architecture, backend, UI/UX, and implementation, building for the Indonesian market.. Deep expertise in getx architecture, Firebase at production scale, multi-tenant data modeling, and delivering complex domain systems end-to-end.

TECHNICAL SKILLS

Mobile: Flutter, Dart 3, multi-flavor monorepo builds, fl_chart, freezed, json_serializable

State & Architecture: GetX State Management, stream-first reactivity, SOLID principles, MockData-first development

Backend & Cloud: Firebase

Platforms: Android · iOS · Windows · Web (Flutter) · Tablet

Design & Tooling: Figma, Claude Design, Stitch.

Integrations: REST API with Dio

Languages: Bahasa Indonesia (native) · English (professional)

PROJECTS

ROAST POS — Multi-Tenant F&B Operations Platform

Founder Project

Architect & Engineer · Flutter · Dart 3 · GetX · Firebase · 6-product monorepo · 680+ tests

- Six products (tablet POS, mobile companion, time-clock, web ordering, admin console, integrated cipos terminal) from a single Flutter monorepo sharing one business-logic core — UI and controllers never access the database directly
- Single-flag data layer swaps the entire backend between live Firebase and deterministic in-memory mock without touching a line of feature code; 680+ passing tests and clean static analysis across the full monorepo
- Enforced restaurant operational state machine (Closed → Preparing → Open → Closing) gating real behavior: trading only when Open, closing blocked until every order is settled, every bill paid, every table cleared
- Multi-station inventory with per-lot tracking, recipe-driven menu availability tied to live stock, and expiry-to-waste disposal flows with full shrinkage records
- Dynamic payment configuration (cash, QRIS, e-wallet, card, bank transfer) as owner-defined data — not a hardcoded list — with per-cashier shift reconciliation and complete drawer movement audit trail
- Configurable approval engine routing sensitive actions (cancellations, refunds, high-value cash movements) through owner-defined authorization paths

ProFund Manager — Project Financial Control Platform

Founder Project

Architect & Engineer · Flutter (web console + mobile companion) · GetX · Firebase · freezed

- Four-state money model (Budget → Reserved → Committed → Actual) with automatic relief at each transition — Available = Budget – Reserved – Committed – Actual reflects true exposure at all times, not just paid invoices
- Flat Firestore schema with ancestor arrays; WBS budget rollout is an ancestor-walk inside a single transaction, aggregating correctly to project root without recursive reads
- Full procurement lifecycle (PR → PO → Goods Receipt → 3-way Invoice match → Payment), DOA approval matrix, CAPEX/OPEX classification, and 30+ financial reports including cash-flow forecasting
- One Flutter codebase, two flavors: dense web/desktop console for managers and a focused mobile companion for directors and field teams, sharing the same domain layer and calculation engine

ELSSA — School Management & Parent Engagement Platform

Founder Project

Architect & Engineer · Flutter · Firebase (per-tenant isolated projects) · Multi-surface SaaS

- Per-school isolated Firebase projects: strongest possible data privacy for biometrics, grades, and financials — no cross-tenant risk; removes the hardest objection when pitching to cautious school leaders and yayasan
- Biometric face/fingerprint gate check-in with anti-spoofing and GPS fallback; parent notification fires the moment a student taps in at the school gate, driving daily active use
- Integrates with Dapodik (government roster import) and e-Rapor (grade export, Kurikulum 2013 & Merdeka) — eliminates double data entry and removes compliance friction from the sales conversation
- Four surfaces: mobile app, web console, biometric gate kiosk, and operator backbone; seven-role design system across all surfaces

SIGAP — Emergency Reporting Platform for Indonesian Fire Services

Founder Project

Architect & Engineer · Flutter · Firebase · Real-time · B2G multi-tenant SaaS

- Three-surface system: citizen panic app, field-responder app (high-contrast, glanceable), and web command dashboard with live incident queue and ticking response clock on every case
- Reframed the product's value around Indonesia's mandated 15-minute waktu tanggap standard (Permendagri 114/2018) — response-time analytics a department director is already accountable for, not just a commodity panic button
- Multi-tenant geographic routing dispatching incidents automatically to the correct municipal department; offline-first with queued reports and SMS fallback

Gym App — Multi-Branch Fitness Platform

Founder Project

Architect & Engineer · Flutter · Firebase · Two-sided app (members + personal trainers)

- Unified booking engine modeling two patterns from one system: seat-claiming (group classes with capacity and waitlists) and provider-reservation (personal training, barber, nails, classes)
- Two-sided architecture on a single codebase: a trainer's bookable slots become member-facing availability; a trainer-assigned workout surfaces directly in the member's progress log

Digital Teller

PT Collega Inti Pratama

Flutter · Android · iOS · Windows · REST API · Java / GoLang backend

- Rebuilt legacy web-based bank teller system as a tablet-first Flutter app (Android/iOS/Windows) — real-time transaction processing, customer account lookups, teller authentication, and branch session management
- Designed responsive UI/UX for banking workflows and integrated secure REST APIs against Java/GoLang backend for real-time customer data and transaction processing

Olibs Hybrid SmartBranch

PT Collega Inti Pratama

Flutter · Windows · GoLang backend · REST API

- Windows-based digital branch frontend (Flutter) backed by GoLang API — handles full branch operations with real-time data synchronization between client and server
- Designed custom branch-workflow UI/UX from scratch; implemented REST API integration for live operational data sync

HRIS — Human Resource Information System

PT Collega Inti Pratama

Flutter · Android · iOS · REST API · Local storage caching

- Cross-platform HR solution (Android/iOS) covering employee profiles, real-time attendance, leave request/approval workflows, and performance evaluation forms with instant notification delivery
- Implemented local storage caching for offline access; all modules synchronized with backend in real time via REST API

Panic Button App — Damkar Banten

PT Collega Inti Pratama

Flutter · GPS location services · Push notifications · REST API

- Lightweight emergency reporting app connecting citizens to a local fire department — GPS location capture on panic-button tap, push notifications to dispatch teams, and simple accessible UI for crisis conditions
- Integrated backend API for incident coordination; predecessor to the SIGAP platform architecture

E-Los Mobile — Loan Management System

PT Collega Inti Pratama

Flutter · REST API

- Mobile loan management client with REST API integration for real-time data synchronization; delivered feature additions and change requests with ongoing code optimization and debugging

Digital Lending

PT Collega Inti Pratama

Flutter · REST API · Custom UI/UX

- Built a digital lending application from scratch — custom UI/UX design, state management, and full REST API integration for real-time data retrieval and synchronization

Thawaff App — Hajj Guidance

Lontar Lab

Flutter · SQLite

- Maintained and extended a Flutter-based Hajj ritual guidance app — added feature modules and change requests, optimized database queries, and improved overall code performance

Lelang Online — Mobile Auction Platform

Founder Project

Architect & Engineer · Flutter · Firebase Cloud Functions · Real-time bidding

- Reframed generic auction as curated, themed drops — a curator assembles a handful of lots, schedules the event, and buyers compete live — scarcity and editorial point of view over an endless marketplace
- Server-side transactional proxy-bidding via Cloud Functions (race-condition-free), anti-snipe soft-close extensions, staggered lot sequencing, and real-time price streaming to all watchers via Firebase listeners

EMPLOYMENT HISTORY

Software Engineer — PT Collega Inti Pratama

November 2020 – Present

Flutter engineer delivering cross-platform mobile and desktop applications for Indonesian banking sector clients. Full project details in the Flutter Projects section above.

- Integrated with Java and GoLang backend engineers on API design and data flow; maintained code quality through static analysis, code reviews, debugging, and performance optimization
- Delivered nine production applications across banking, HR, lending, and emergency response verticals on Android, iOS, and Windows using Flutter and GetX

Intern Mobile Developer — Lontar Lab

October 2019 – January 2020

- Contributed to mobile application features across the full SDLC — design, coding, testing, and documentation; participated in daily stand-ups under senior developer mentorship

EDUCATION

S1 Computer Science — Universitas Terbuka

August 2024 – Present

Software Engineering — SMKN 2 Kota Sukabumi

July 2017 – July 2020

- 1st place, Lomba Kompetensi Siswa (LKS) — Software Application Development, Sukabumi City (2018 & 2019)
- Runner-up, West Java Provincial Level LKS — Software Application Development (2018 & 2019), competing in C#

CERTIFICATIONS

Dicoding: Flutter App Development (Beginner · Fundamental · Intermediate–Expert) · SOLID Principles · Android Studio App Development (Beginner)

BNSP: 2nd Level KKNi Software Engineering Competency — Badan Nasional Sertifikasi Profesi

LontarLab: Certificate of Competency
